

1.0 Environmental and Energy Conservation Policy

We conduct our business in an ethical and socially responsible manner, protecting the environment and conserving energy.

We comply with all environmental legislation required by law and all recognized international, national and industry regulations and standards relevant to the environmental aspects of our activities and services ashore and onboard.

We periodically review and revise our environmental protection measures by setting and reviewing environmental objectives and targets. We follow the Plan-Do-Check-Act (PDCA) model within ISO 14001 to achieve continual improvement, fulfill compliance obligations and address risks versus opportunities.

We aim to preserve an industry-leading position on climate change by improving operational energy efficiency and by researching environmentally safe technologies that will reduce our carbon footprint on new and existing ships.

Our goal is to prevent the release of any unlawful pollutants into the sea, land or air by eliminating spills, by ensuring a safe and secure working environment, and by following best practices after assessing all environmental risks.

We conserve energy and materials through our energy conservation, waste management and ship recycling programs.

We consider environmental factors when making operational decisions and when purchasing environmentally and safe goods and services. We identify the most sustainable and effective chemical products for use throughout the fleet and keep their use to the absolute minimum.

We continuously educate and encourage our employees on the importance of their environmental responsibilities through training and communications.

We communicate this policy to all our employees, contractors, and suppliers so they understand our commitment.

We publish our policy and disclose our environmental information on a regular basis.

Mark Martecchini
